1. Background

Software Overview

The SNAPSTER app is being developed to provide a decentralized social media platform for sharing videos and audio content. The purpose of the software is to allow users to easily share and browse content from their mobile devices, with no centralized data storage.

The app will include additional features such as user accounts, friending, avatars, chat/DM ability, video/camera recording, and custom filters. Users will be able to earn points by sharing content, which can be used for avatar customization or purchased directly from the company. The app will run on mobile platforms such as iOS and Android. The application is relatively novel in its decentralized approach to social media, and there may be technical risks associated with the point-to-point file sharing and parallel download features. External inputs and outputs will include user-generated content, updates to custom filters from the company repository, and advertisements from sponsors.

The quality attributes of the app will need to be considered, such as reliability and security of user-generated content. The development team will include architects, engineers, and other technical professionals responsible for system development and operation. The team will utilize various development, integration, and testing tools to ensure the app is functional and reliable.

Organization / Environment Overview

Muhammed Ghazi is the project manager and will be overseeing the project to ensure its completion on time and within budget. The project manager will be the bridge between stakeholders, investors, and customers. He is also responsible for working closely with the team to ensure efficient development.

Steven Jamaica is the lead developer and will be responsible for writing efficient code with minimal bugs. The team specializes in both front-end and back-end development. The lead developer works closely with the developer, project manager, and tester to ensure the specifications and requirements are met. The developer is under the development team.

Manushi Parajuli is a QA tester and is responsible for testing the quality and functionality of the app to meet the project requirement. The QA is responsible for creating test plans, executing, and reporting bugs/issues to the developer. They work closely with the developer to ensure the delivery of a high-quality application. The QA tester is also under the development team.

Snapster is headquartered in Texas to reduce the overhead cost of living. Around forty percent of the employees work remotely, twenty percent hybrid, and forty percent work on-site. Around twenty percent of the remote workers are outsourced overseas to reduce the

time and cost of software development. As a startup company, Snapster hires mostly young developers with limited work experience. A few developers who are highly experienced (around 7-10) will be leading the team. The company will hire a few Computer Science interns to help the developers and testers. Most of the lead developers will be working on-site. The interns and inexperienced developers work hybrid. The overseas team and limited experienced developers will work remotely. The team will work five days a week. The overseas developers will be working during the US nighttime.

The development team (software developers, designers, and testers) is responsible for building and testing the software. The team of system administrators, network engineers, and database administrators will take care of operating the system. The development and operation team will also maintain the system in addition to building, testing, and operating it. The main groups of people involved in the system development are architects, engineers, designers, and QA testers. Architects are responsible for designing the overall system architecture including the hardware and software components. Software engineers are responsible for the coding part whereas UI/UX designer is responsible for designing the front end. The designer and the engineer on our project are in the same development team. QA testers are primarily responsible for detecting bugs and reporting to the developers.

In a high-level sense, the architects would communicate the system design to the developers and the developers will write code accordingly. The designers and developers collaborate to create an attractive and convenient user interface. The QA testers provide feedback to the development team to improve the app's quality and identify and report issues/bugs. All these groups work together to ensure the timely delivery of the app while meeting user expectations.

Schedule / Effort Overview

For the development of Snapster, project plans like Work Breakdown Structure (WBS) and Basis of estimation (BOE) are crucial. The project schedule to achieve milestones are planning, design, development, testing, and deployment.

In the beginning, around thirty main developers and designers might be enough to develop the Snapster. Around 5 testers are necessary. Programming languages and frameworks like Java, React, Swift, etc. will be used. IDE like Android Studio and Eclipse will be used. MySQL and MongoDB to store, manage, and retrieve the data. Cloud hosting services like AWS will be utilized.

Breaking down of the project into smaller and manageable tasks will simplify the project and increase the overall efficiency. So, we will assign the task to a specific team lead who will ensure the project progresses smoothly. IP Multimedia Subsystem will be used to create a project schedule.

Management Overview

Technical and Managerial aspects of the program are as follows

Technically, the development of Snapster will require the utilization of various tools and technologies for various stages of the software development lifecycle. These tools may include programming languages like Java, Python, or Swift, as well as development environments such as Eclipse or Xcode. Also, various software testing and integration tools will be used to ensure the system's quality and performance, such as JUnit or Selenium for automated testing, and Jenkins or Travis CI for continuous integration. The technical strategy must be defined to ensure that the system is developed in a scalable, efficient, and secure way, with appropriate use of caching, load balancing, and security protocols.

Managerially, the project will require the coordination of various teams and stakeholders, such as developers, architects, project managers, and business analysts. An Agile development methodology may be used, with regular sprint planning, review, and retrospectives. Effective communication, collaboration, and decision-making will be essential for the project's successful delivery. Technical development risks may include issues related to data privacy, security, compliance, scalability, and performance. These risks must be identified, assessed, and mitigated throughout the project lifecycle.

2. Program Plan Software Process Model

The Appropriate software process model to choose for the Snapster™ app would be the Unified Process Model. The app relies on user interaction as there is no centralized photo library or video gallery that is saved in the Snapster™ database. Since the users must generate and share content that would allow them to interact with their social circle and even meet others outside that social circle, then the entire structure of the app is built around their desire to express themselves and to communicate with others. The company essentially just has to provide updates to keep the application interesting and to accommodate for new fads that the users would like to see and interact with so that the company can retain users.

Communication: Initial communication for the inception of Snapster[™] would be with the Stakeholders and Software Engineers. As the Project progresses and a working application is built it can be submitted into the two main markets for mobile apps, such as Google Play® and Apple's App Store®. Once the application has had a run with the open public we prioritize the

feedback and opinions of customers just as much as major stakeholders as the evolution and upkeep of the app will no longer rely just on stakeholder money.

Planning: The initial planning of the app begins with the software developers and the Stakeholders, as time progresses with a working application, the opinions of the users are taken into account and any final decision will have the feedback of the stakeholders, the developers, and the users.

Modeling: During initial modeling, prototypes can start being made and a general idea for the app's architecture can begin to take shape. Prototypes can be shown to stakeholders for opinions on how to move the project forward and any beginning bugs can be addressed. As time progresses any future models will be built upon past models and any features that weren't implemented well or disliked can be addressed and new prototypes can be formed.

Construction: The main features for the app's first deployment are made with the stakeholder's ideas in mind. These are prototypes that will have functions that aren't completely done being worked in and bugs will be present, they are addressed as they come and the main focus is to have features that can expand the base use of the app which is image and video sharing. Over time new features will be implemented in this stage and a test group will have an unreleased version of the app with new features and see how it begins to behave on a daily basis.

Deployment: At this stage there is a small group of people that will have an unofficial released project, the feedback from this group will help shape the official release to the public and any issues that weren't found in the modeling or construction phase can be addressed and the group can give a nice outside perspective of the use of the app. They are essentially a sample size of the overall public.

Software increment/Release: At this stage a working product has been made with minimal bugs and issues, the past prototypes and test cases have proven that the product is safe, usable, and appealing to the overall target audience, and any future changes will be made with the feedback of the day-to-day users and the wants of the stakeholders.

Team Decomposition

Novice: Steven Jamaica Cervera

Salary Range: \$70,000 – \$80,000

Would be responsible for the less intricate features such as; UI color, typeface, help options, the privacy feature that lets users decide what can be downloaded, the point system for users to share

more content, the account settings for logging in, friend requests, chat and direct messaging options, and the content search menu.

Journeymen: Manushi Parajuli

Salary Range: \$110,000 - \$120,000

Would be responsible for more intricate features in the software such as; recording and local storage for media, implementing the filters from the company repository, the sharing of media to other friends including stories, downloading content into cache, the point of sale for the point base system, and implementation of advertisers in story review mode. They would also be responsible for the copyright notice notification.

Expert: Muhammad Ghazi

Salary Range: \$158,00 - \$168,000

Would be responsible for the oversight of the project and one of the main leaders in determining what features can be developed as well as the architecture of the software. They would be responsible for the decentralization of media being shared among users, this means they are responsible for the point-to-point system (seeding) that makes the media quicker to download with more people having that media saved on their devices, this saves the company from having huge database systems to store the unquantifiable number of media being shared. They would also be responsible for choosing the advertisers that would be implemented into the story review mode. Since they are involved with very important information, they are also responsible for the prevention of user information from being easily attacked and accessible.

Work Breakdown Structure (WBS)

Work Breakdown Structure Table

Provide basic information about the project including: Project Title – The proper name used to identify this project; Project Manager - the person with responsibility for the successful delivery of the project to time cost and quality. Prepared by – The person(s) preparing this document; Date/Control Number – The date the plan is finalized and the change or configuration item control number assigned.

Organizational Breakdown Structure (OBS)

Basis of Estimate

| BOE ID: | WBS: ALL | |
|-------------------------------------|----------|--|
| Author Name: Steven Jamaica Cervera | Level 3 | Period of Performance: 60 hours per leg 3 people |
| | | Total Hours 1260 |

Task Descriptions: (List out all WBS)

<WBS delineation of tasks here>

- 1.1: User Interface: This incorporates all WBS for User Interface
- 1.2: Data Management: This incorporates all WBS for Data Management
- 1.3: Cybersecurity: This incorporates all WBS for Cybersecurity

Basis of Estimate:

Burden Rate = 1.4

1. = 75,000/1.4 = 53,571.40 = lines of code per year

2. = 120,000/1.4 = 85,714.30 = lines of code per year

3. = 192,000/1.4 = 137,143.00 = lines of code per year

1.6 = 15,000/1.4 = 10,714.30

1.9 = 18,000/1.4 = 12,857.10

1.11 = 25,000/1.4 = 17,857.10

1.12 = 25,000/1.4 = 17,857.10

1.13 = 30,000/1.4 = 21,428.60

Labor Estimate:

| WBS | Task Description | Calculation | Period | Hours |
|-----|------------------|-------------|-----------|-------|
| 1.1 | User Interface | 60 * 7 | 420 hours | |
| 1.2 | Data Management | 60 * 7 | 420 hours | |
| 1.3 | Cybersecurity | 60 * 7 | 420 hours | |
| | | | | 1260 |

Material Estimate:

| WBS | Purchase Description | Calculation | Cost |
|-----|--------------------------|-------------|------|
| 1.1 | User Interface | 53,571.40 | |
| 1.2 | Data Management | 85,714.30 | |
| 1.3 | Cybersecurity | 137,143.00 | |
| 1.6 | Independent verification | 10,714.30 | |
| 1.9 | Consultation | 12,857.10 | |

| 1.11 | Quality Assurance | 17,857.10 | |
|------|-------------------|-----------|------------|
| 1.12 | Documentation | 17,857.10 | |
| 1.13 | Travel | 21,428.60 | |
| | | | 303,571.00 |

Trips Estimate:

| WBS | Trip Description | Calculation | Cost |
|------|------------------|-------------|--------|
| 1.9 | Consultation | 12,857.10 | \$XXXX |
| 1.13 | Travel | 21,428.60 | |
| | | | |
| | | | 34,285 |

Rationale/Estimating Methodology:

All prices for numbers come from a calculation of average salaries in Texas, level of expertise of software developers, and usually cost of business over the course of a year. The initial budget was very generous in amount that was going to be received and spent. The prices came from a simple calculation of burden rate and total for the year, there could be errors, but future planning is done repeatedly over the course of the project and the budget gets reassessed.

Schedule

This is the overall timeline of the software development, note this is just for the milestones, any meeting with stakeholders and financial and legal teams can take place before the due dates. Testing can be done at any time to combine all software parts from teams. A final trial of the app and its software will be done once all pieces have been put together. This schedule was made with having a working prototype in a minimal time frame.

Snapster™

Timeline of Software Development

First Leg

| Name | Subitems | Person | Status | Date |
|--------------------------------------|----------|---------------------|------------------|--------------------------|
| Basic UI | Test | Steven Jamaica | Working on it | 2023-03-01 |
| Media Capture and Storage | Test | Manushi Parajuli | Working on it | 2023-03-02 |
| Messaging encryption 1st check | Test | Muhammad Ghazi | Working on it | 2023-03-04 |
| | | | | 2023-03-01 to 2023-03-04 |

Second Leg

| Name | Subitems | Person | Status | Date |
|--------------------------------------|----------|---------------------|------------------|--------------------------|
| Typeface choice | Test | Steven Jamaica | Working on it | 2023-03-08 |
| Filter Implementation | Test | Manushi Parajuli | Working on it | 2023-03-09 |
| Messaging Encryption 2nd check | Test | Muhammad Ghazi | Working on it | 2023-03-10 |
| | | | | 2023-03-08 to 2023-03-10 |

Third Leg

| Name | Subitems | Person | Status | Date |
|------------------|----------|-------------------|------------------|------------|
| Profile Settings | Test | Steven Jamaica | Working on it | 2023-03-15 |

| Cache download | Test | Manushi Parajuli | Working on it | 2023-03-16 |
|--|------|---------------------|------------------|--------------------------|
| Messaging Encryption Final Check | Test | Muhammad Ghazi | Working on it | 2023-03-17 |
| | | | | 2023-03-15 to 2023-03-17 |

Fourth Leg

| Name | Subitems | Person | Status | Date |
|------------------------------------|----------|---------------------|------------------|--------------------------|
| Privacy Settings | Test | Steven Jamaica | Working on it | 2023-03-22 |
| Payment Acceptance | Test | Manushi Parajuli | Working on it | 2023-03-23 |
| Point to Point Method 1st check | Test | Muhammad Ghazi | Working on it | 2023-03-24 |
| | | | | 2023-03-22 to 2023-03-24 |

Fifth Leg

| Name | Subitems | Person | Status | Date |
|------------------------------------|----------|---------------------|------------------|--------------------------|
| Help Settings | Test | Steven Jamaica | Working on it | 2023-03-29 |
| Copyright notice implementation | Test | Manushi Parajuli | Working on it | 2023-03-30 |
| Point to Point Method 2nd Check | Test | Muhammad Ghazi | Working on it | 2023-03-31 |
| | | | | 2023-03-29 to 2023-03-31 |

Sixth Leg

| Name | Subitems | Person | Status | Date |
|--------------------------------------|----------|----------|------------------|------------|
| Point to Point Method final check | Test | Everyone | Working on it | 2023-04-07 |
| | | | | 2023-04-07 |

Last Leg

| Name | Subitems | Person | Status | Date |
|--------------------------|----------|-------------------|------------------|--------------------------|
| Marketing Approval | Test | Muhammad Ghazi | Working on it | 2023-04-14 |
| Marketing implemantation | Test | Everyone | Working on it | 2023-04-15 |
| | | | | 2023-04-14 to 2023-04-15 |

3. Problem Definition

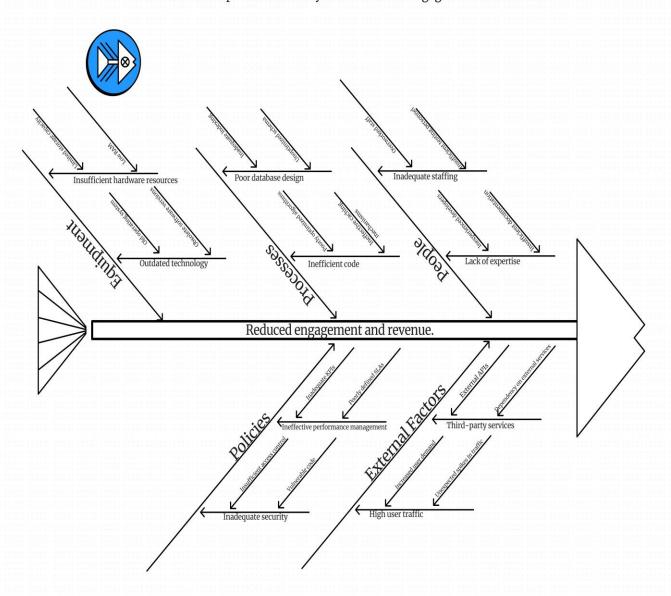

Problem Statement

| Element | Description |
|---------------------|---|
| The problem of | The problem of decreasing performance due to increasing user base in Snapster affects the user experience and may lead to reduced engagement and revenue. |
| Affects | Users, Company |
| the result of which | Users abandoning the platform or negative reviews affecting Snapster's reputation. |
| benefits of | improved user satisfaction, increased engagement and revenue, and a positive reputation for Snapster. |

Root Causes

Root Cause Analysis Fishbone Diagram

The problem of decreasing performance due to increasing user base in Snapster affects the user experience and may lead to reduced engagement and revenue.

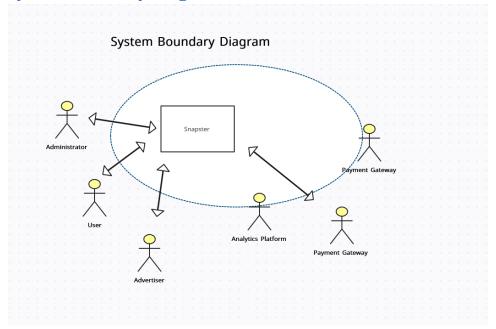

Stakeholders & Users

| Users | Other stakeholders |
|-------|--------------------|
| | |

| Businesses | Investors |
|-------------------|-------------------|
| Salespeople | Advertisers |
| Multimedia houses | Content creators |
| Creators | Development Team |
| Administrator | Financial Manager |
| | |

System Boundary Diagram

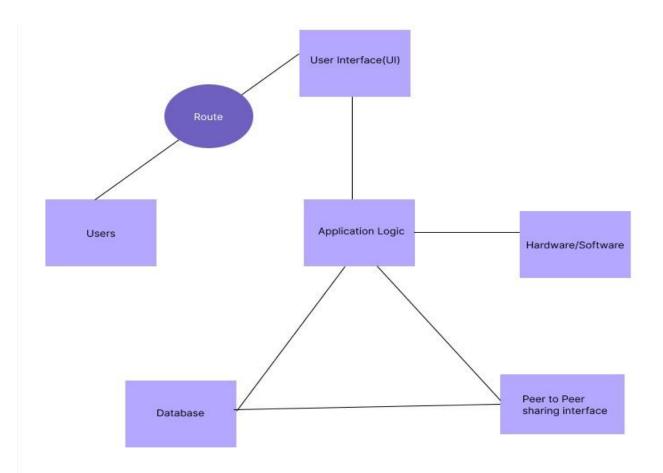

Constraints

| Source | Considerations |
|------------------------|--|
| System | Is it to be built on our existing systems? system is scalable, reliable, and secure What O/S and environments must be supported? Data migration compatibility What kind of resources will be required for ongoing maintenance and support? |
| Environmental | Environmental or regulatory constraints? Legal requirements? Security requirements? |
| Schedule and resources | optimizing resource allocation? minimal wastage Usage of outside labor permissible? managing delays? ensuring that project milestones are achieved |
| Economic | What financial or budgetary constraints are applicable? Ways to earn revenue Free or paid app Licensing issues? |
| Legal | Any internal or external political issues that affect potential solutions? compliance with data privacy laws? compliance with intellectual property rights? compliance with industry-specific regulations? |

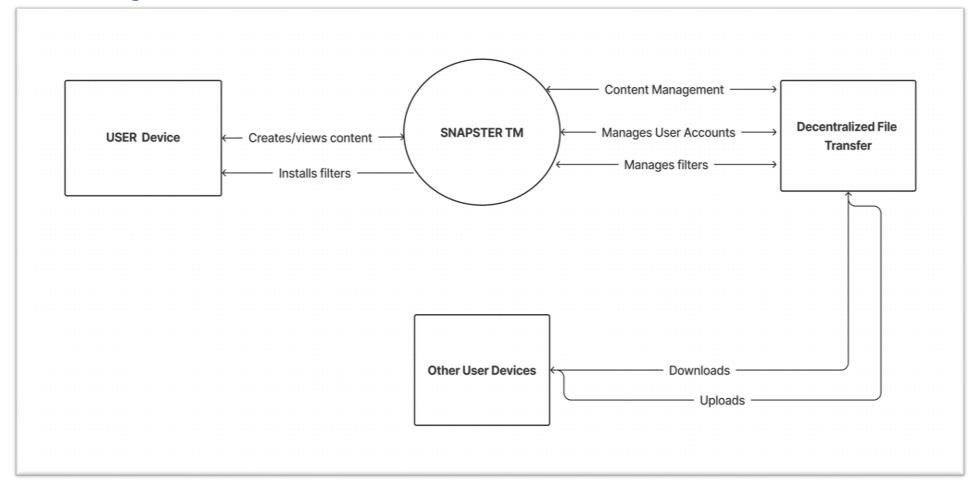

| Technical | Restricted in any of the app stores? |
|-----------|--|
| | ■ Limited to only new OS? |
| | Prohibited from any modern technologies? |
| | ■ Licensed plugins? |

11. Functional Requirements

The following demonstrates iterative requirements development for Mousey. FR 1 and FR1.1 and !.2 may have started with the first 2 statements. "60 seconds has passed" may have been discovered while exploring abnormal scenarios while meching out use cases.

FR1 The game shall implement a turn-based system.

| FR1.1 | A Player's Turn shall be completed when a player places a Barrier on the Game Board |
|-------|---|
| FR1.2 | A Player's Turn shall be completed when a player removes a Barrier from the Game Board |
| FR1.3 | A Player's Turn shall be completed when 60 seconds has passed without an action |
| | |

FR1 The browser shall allow for users to request websites.

| FR1.1 | The browser shall allow a user to directly request a website via URL entry |
|-------|---|
| FR1.2 | The browser shall implement click features to navigate to a URL (i.e. hyperlinks) |
| | |
| | |

FR1 The editor shall deconflict user input.

| FR1.1 | The editor shall lock the area from other user input for up to 20 characters around |
|-------|---|
| | the user's cursor. |
| FR1.2 | The editor shall display the conflicted area on other users' screen. |
| | |
| | |

12. Nonfunctional Requirements

NF1. The application shall have a crash rate of less than once every 1000 games

NF2. ...

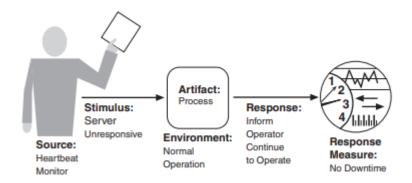

13. Traceability Tables

| Use Case | Requirements |
